RAW MATERIALS FOR PLASMA FRACTIONATION

Blood Plasma Fractionation

Human plasma contains proteins of high therapeutic value, which are prepared from the pooled plasma of many donors. They are also called plasma derivatives, i.e. concentrates of specific plasma proteins, which are obtained through a process known as fractionation.

The main fractionation steps include precipitation, purification and virus inactivation. Therefore, plasma derivatives are heat treated and / or solvent detergent-treated to kill certain viruses like those that cause HIV or hepatitis.

Plasma derivatives include :

- Factor VIII
- Factor IX
- Anti-Inhibitor Coagulation Complex (AICC)
- Albumin
- Immunoglobulins, including Rh Immunoglobulin
- Anti-Thrombin III
- alpha 1-Proteinase Inhibitor

These proteins are used for e. g. haemophilia or autoimmune disorders treatment.

We are fully aware of the safety and quality requirements to prepare such therapeutic proteins. Therefore, we shall be your first choice as supplier of reagents for plasma fractionation.

- **High-quality raw materials** that fulfill Pharmacopoeia specifications.
- **Documentation** for register and approval available (MSDS, regulatory certification, manufacturing process).
- **Effectiveness** of the purification process guaranteed reliably.

Raw materials for the precipitation of proteins

Whatever parameter has to be modified: pH, ionic strength or ethanol concentration, with our reagents, you may adjust to the required conditions to precipitate the plasma proteins.

Raw materials for protein purification

Fractions obtained from plasma after precipitation are still complex mixtures and do require further purification steps.

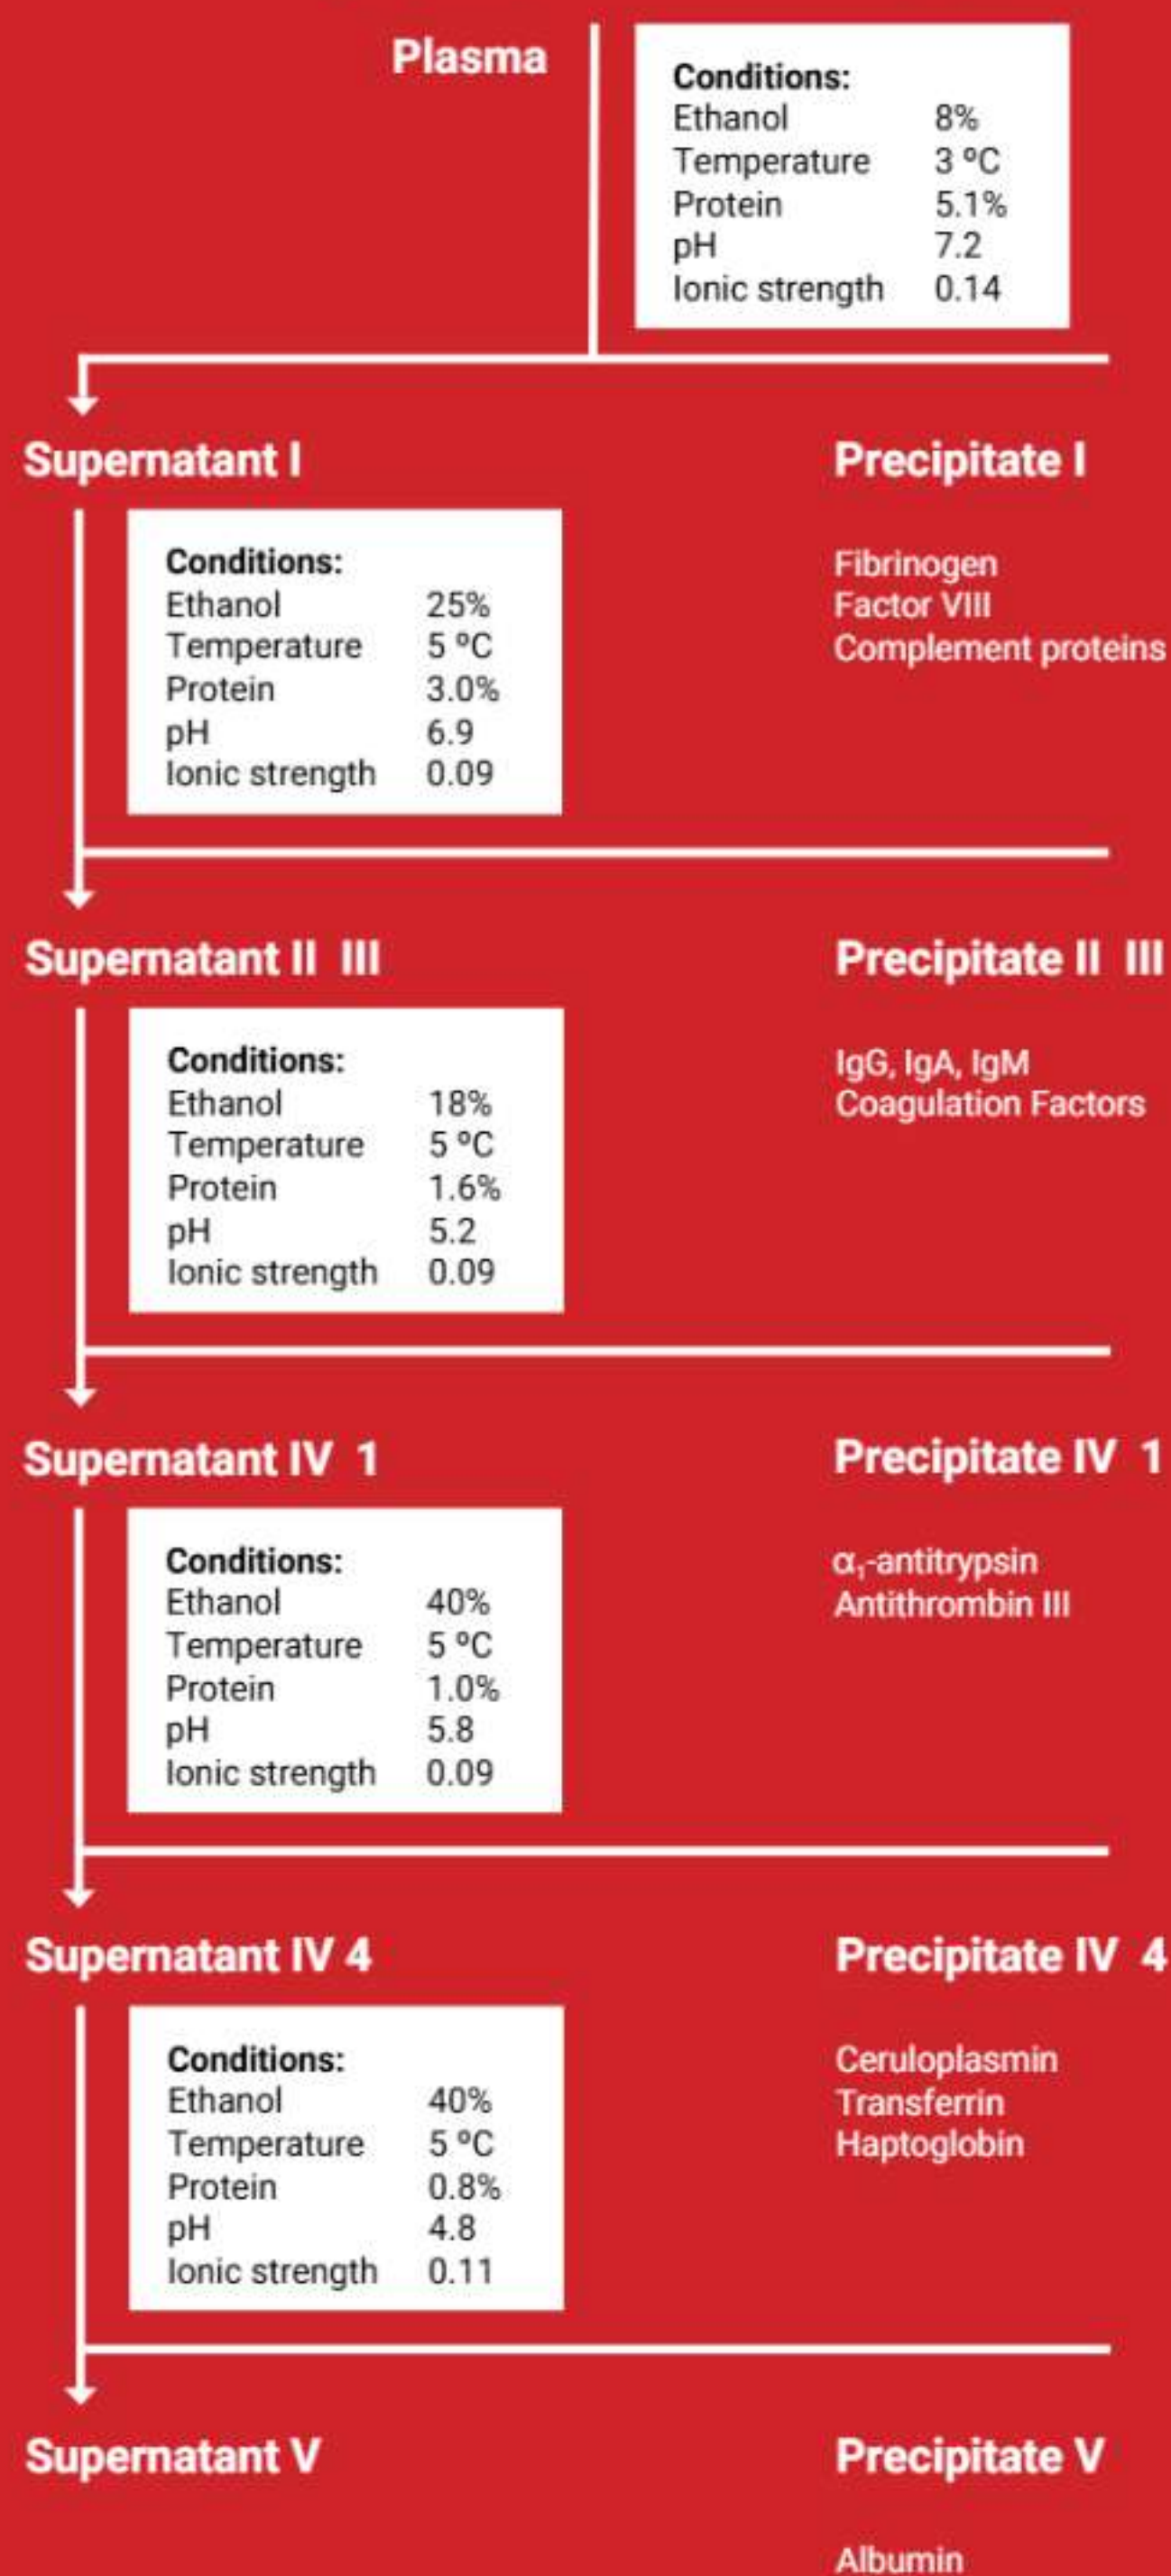

Purification techniques include :

- Filtration
- Affinity Chromatography (AC)
- Immobilized metal ion affinity chromatography (IMAC)
- Size exclusion chromatography (SEC)
- Ion exchange chromatography (IEX)

A good elution is achieved by increasing the salt concentration, modifying pH and polarity, adding chaotropes and/or detergents. Additionally, it is critical to select the appropriate buffer.

Blood Plasma Fractionation Scheme

This reaction scheme is an example of how a plasma fractionation may be performed. The scheme was adapted from Curling, J. (2002) *BioPharm Int.* 15(10), 16-26

Raw materials for virus inactivation

The virus inactivation is an essential step to prevent contamination by viruses such as Hepatitis or HIV. Apart from a very strict control and selection of donors, some virus inactivation steps are carried out before final product release.

The chemical treatment used for virus inactivation are:

- Low pH treatment
- Pasteurization (requires a stabilizer like sucrose, glycine or sodium caprylate)
- Solvent/detergent treatment
